## Preface

Thank you for purchasing Wireless LAN Adapter. This manual will assist you with the installation procedure and is valid for Wireless LAN adapters.

### Wireless LAN Basics

Wireless LAN (Local Area Networks) systems offer a great number of advantages over a traditional, wired system. Wireless LANs (WLANs) are more flexible, easier to setup and manage and often more cost effective than their wired equivalence.

Using radio frequency (RF) technology, WLANs transmit and receive data over the air, minimizing the need for wired connections. Thus, WLANs combine data connectivity with user mobility, and, through simplified configuration, enable movable LANs.

With wireless LANs, users can access shared information without looking for a place to plug in and network managers can set up or augment networks without installing or moving wires. Wireless LANs offer the following productivity, convenience and cost advantages over traditional wired networks:

- **Mobility** - Wireless LAN systems can provide LAN users with access to real-time information anywhere in their organization. This mobility supports productivity and service opportunities not possible with wired networks.
- **Installation Speed and Simplicity** - Installing a wireless LAN system can be fast and easy and can eliminate the need to pull cable through walls and ceilings.
- **Installation Flexibility** - Wireless technology allows the network to go where wires cannot go.
- **Reduced Cost-of-Ownership** - While the initial investment required for wireless LAN hardware might be higher than the cost of wired LAN hardware, overall installation expenses and life-cycle costs will be significantly lower. Long-term cost benefits are greatest in dynamic environments requiring frequent moves, adds, and changes.
- **Scalability** - Wireless LAN systems can be configured in a variety of topologies to meet the needs of specific applications and installations. Configurations are easily changed and range from peer-to-peer to full infrastructure networks, also allow roaming over a broad area.

#### **Warning**

- Compatibility with IEEE 802.11n future version is not guaranteed.
- Compatibility with IEEE 802.11n draft devices from other manufacturer is not guaranteed.

## Installation Overview

### Introduction

Before installing Vigor N61, make sure that there is already an Access Point existed on the wireless network. It is needed in case of Infrastructure network mode.

Here are some steps you will perform in establishing your wireless network connection:

- Install the USB Driver for Vigor N61 by using the Install CD.
- Install the Wireless card.
- Configure network protocol(s) that is required to communicate on your network. Most likely you will need the TCP/IP protocol.

### Installation Procedure

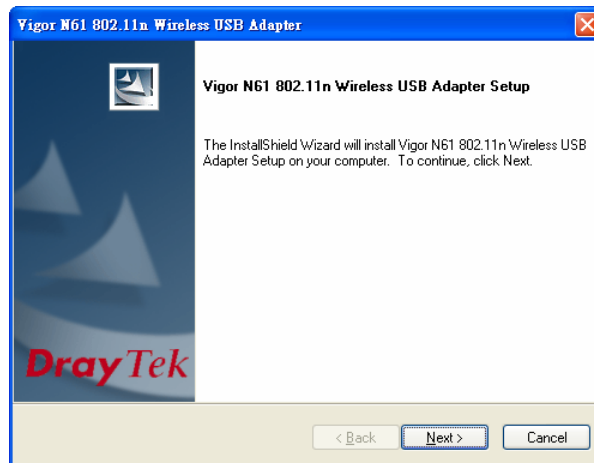

**Important !!** Before you installing USB driver for Vigor N61, do not insert the wireless adapter in your computer.

Follow the step below to install USB driver.

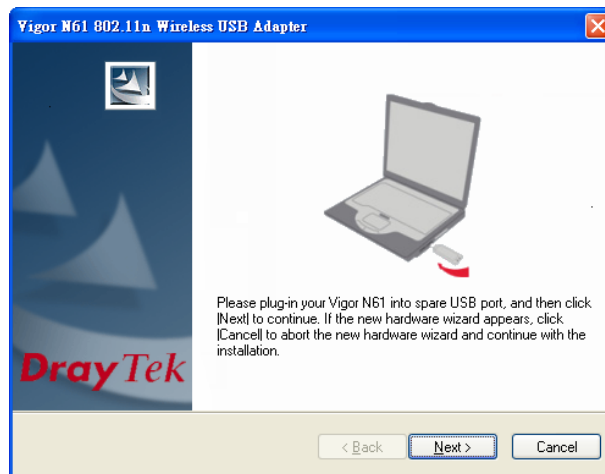

1. Insert the CD into your computer. The following screen will appear.

2. The setup wizard will appear as follows. Please click **Next**.

3. Now, you can insert Vigor N61 to the USB port of your computer. Then click **Next**.

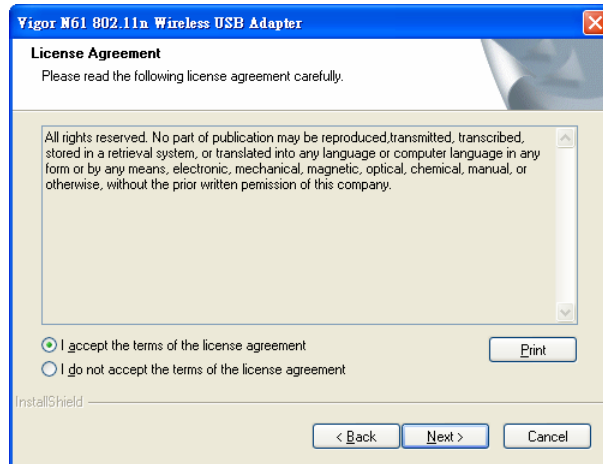

*Connect with USB cable*

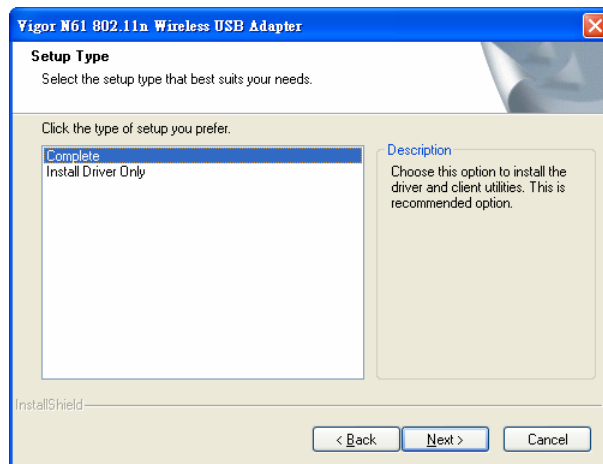

*Connect directly*

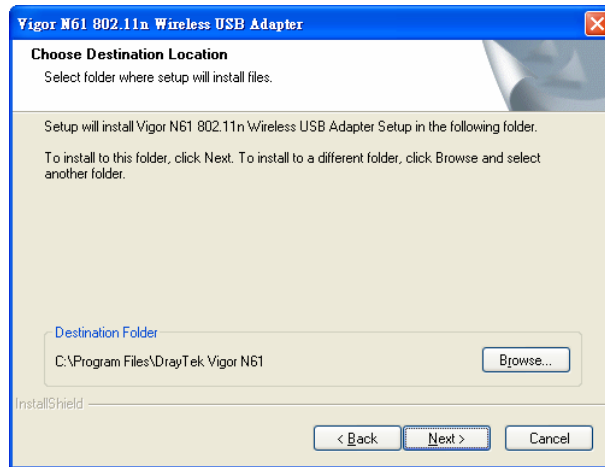

4. In this page, you have to choose **“I accept...”** to continue the installation. If you do not accept the agreement, you can click **“I do not...”** to exit the wizard. And the driver installation will not be installed to your computer.

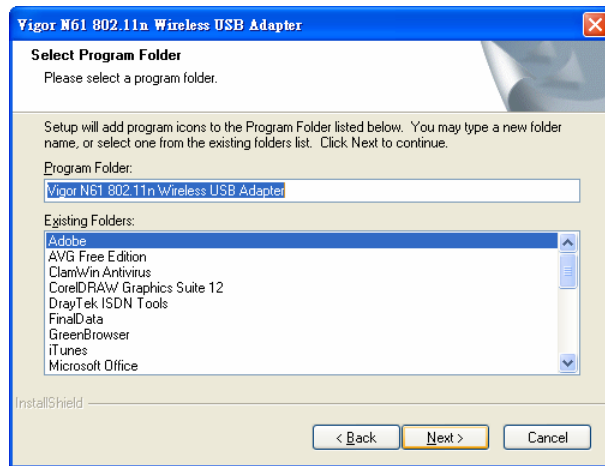

5. There are two types of setup that you have to choose, **Complete** or **Install Driver Only**. If you do not know which one is proper, simply choose **Complete** and click **Next**.

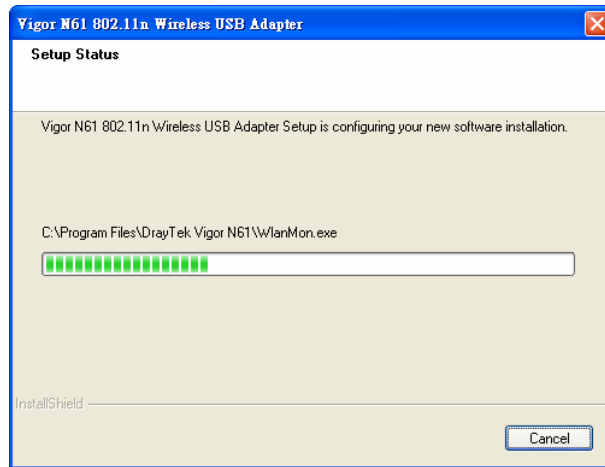

- The default destination folder will be specified in this page. Also, you can click **Browse...** to choose another folder for storing the driver. Click **Next**.

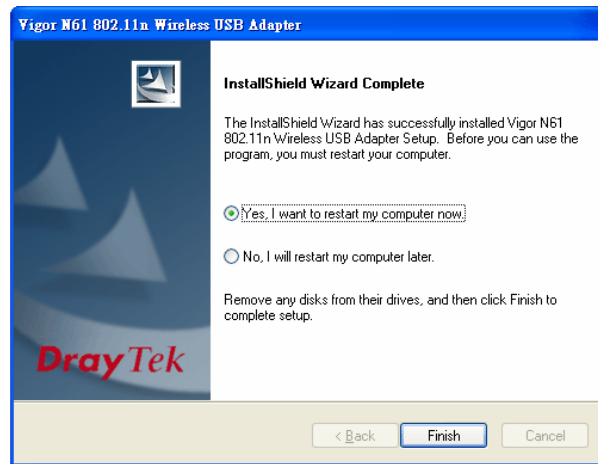

- A default program folder will be offered by the setup program. If you do not want to change it, simply click **Next**.

- The setup program is executing the installation by copying corresponding files to your computer.

- Now the system will ask you to restart your computer to complete the whole installation. After choosing the proper setting, please click **Finish**.

- After restarting your system, the system will find out the hardware (wireless LAN card) automatically. When it locates, a message will be shown on the system tray.

- Now, you can find the N61 utility icon in the system tray. Double click it to open the configuration window of Vigor N61 wireless adapter.

## Uninstalling USB Driver

If you want to remove the driver for this wireless card, please do the following:

1. Run **Start >> Programs>> Vigor N61 802.11n Wireless USB Adapter Utility>>Uninstall**.

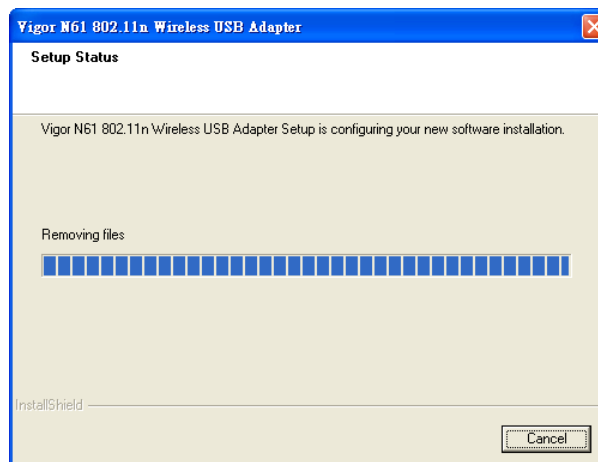

2. The Preparing Setup will appear.

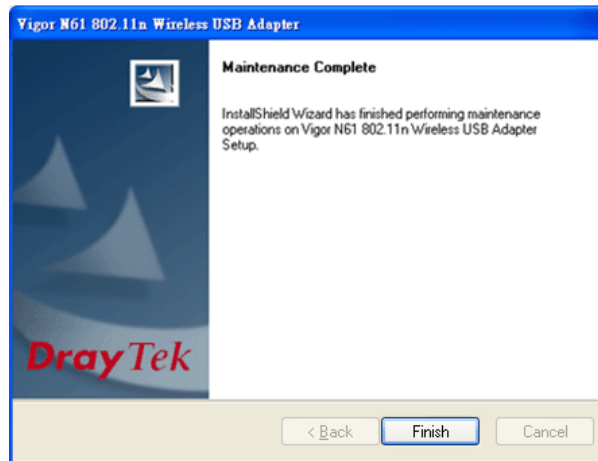

3. When the following screen appears, please click **OK**.

4. Now, the system starts to remove the corresponding files.

5. When the following dialog appears, please click **Finish**.

This page is left blank

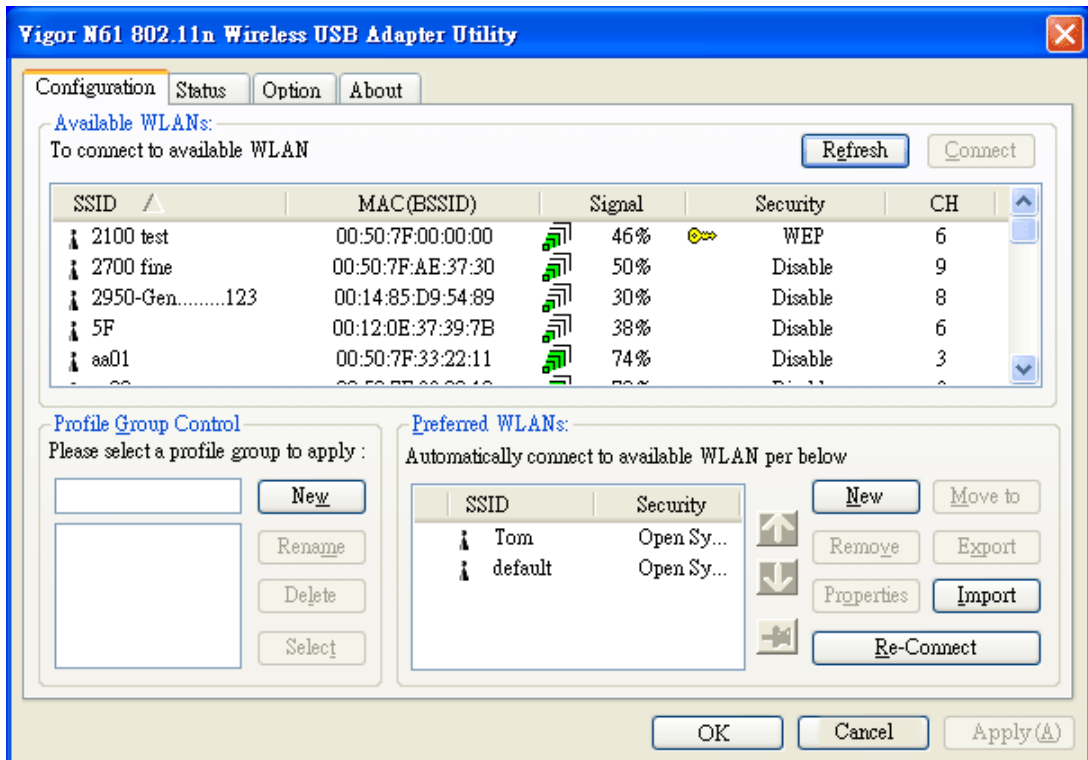

# 3 Configuration

## Wireless USB Adapter Utility

After finish the driver installation, it is the time to configure the wireless utility for accessing into Internet through wireless connection. Double click on the N61 utility icon on the system tray. Or open the wireless monitor utility by **clicking Start >> Programs>> USB Wireless LAN Card >>802.11g USB Wireless LAN Card Utility.**

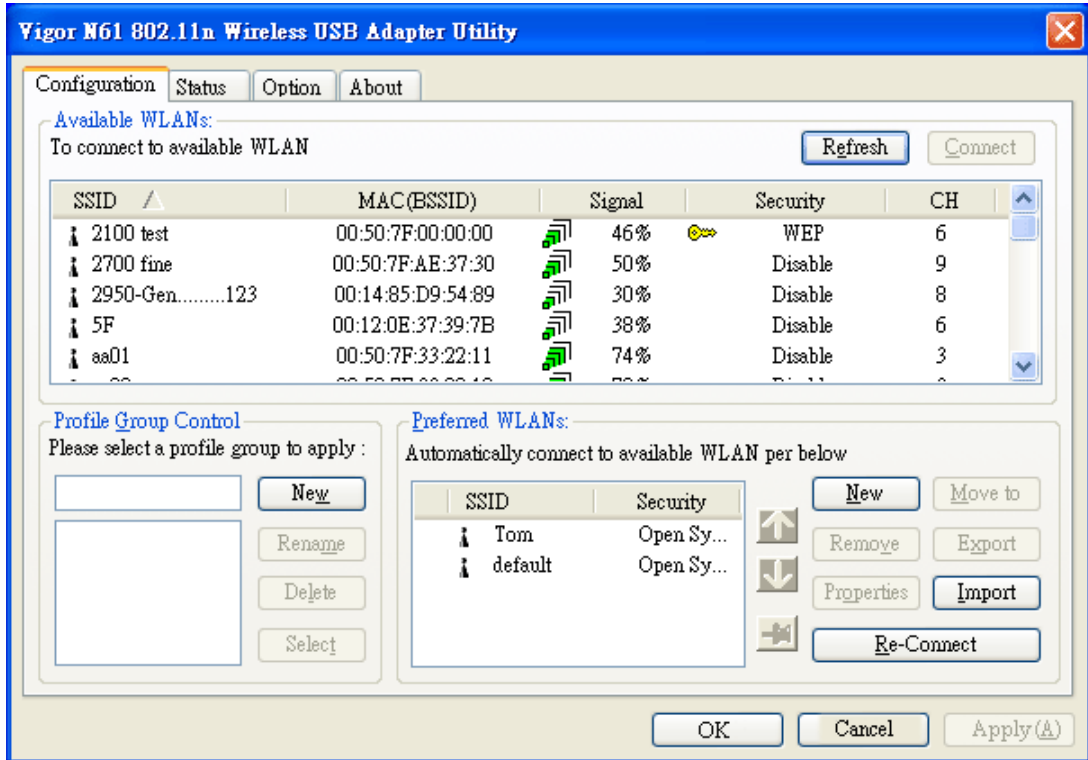

The **Wireless USB Adapter Utility** window will appear as the following. Basically, the software will scan and display available wireless AP automatically.

*This chapter will introduce each tab in detail. Also, an example of configuration will be provided for your reference.*

## Configuration

The wireless USB adapter utility will find out all the available Access Points and list them automatically for you to choose. *The following figure is just an example. The real available list depends on the AP(s) that found around your computer system.*

In the field of **Available WLANs**, you can see:

### SSID

It displays the SSID of the AP.

means the AP is ready for you to connect

means connecting to that AP successfully

means connection is failed.

If the available APs are many, scroll bars will appear for the user to scroll and select preferred AP. Please select the one (Access Point) that you want to connect for accessing Internet.

### MAC (BSSID)

It means the MAC address of current wireless card.

### Signal

The more the percentage is, the better the link quality will be.

### Security

It displays security method that the AP used.

### CH

It displays the connection channel that the AP used.

### Refresh

It can re-search available APs on wireless network whenever the user clicks it. By the way, the whole list will be refreshed in a certain time automatically.

### Connect

It starts to build a connection between the station (client) and the AP.

In the field of **Profile Group Control**, you can see:

**New**

It allows you to add a new profile to group several APs. Click New to open the following dialog box. Type a new name in the box and click OK.

The new group with the name you typed will be shown as the following.

**Rename**

It allows you to modify the selected profile name.

**Delete**

It allows you to delete the selected profile.

**Select**

It allows you to select one profile for use.

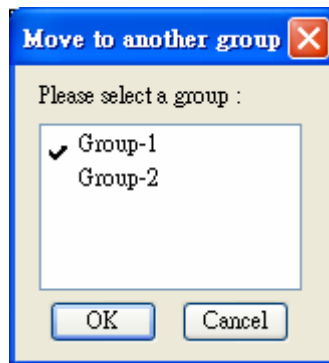

In the field of **Preferred WLANs**, you can see:

**SSID** It displays the SSID of the AP.

**Security** It displays security method that the AP used.

**New** It allows you to add a new profile.

**Move to** It allows you to move a selected profile to another profile group. After click this button, the following dialog will appear for you to assign which group that you want to move to.

**Remove** It allows you to select one of the existed profiles and click this button to remove it.

**Export** It allows you to save the profile record as a file with file format of .AWP. Please type the required password as shown in the following dialog.

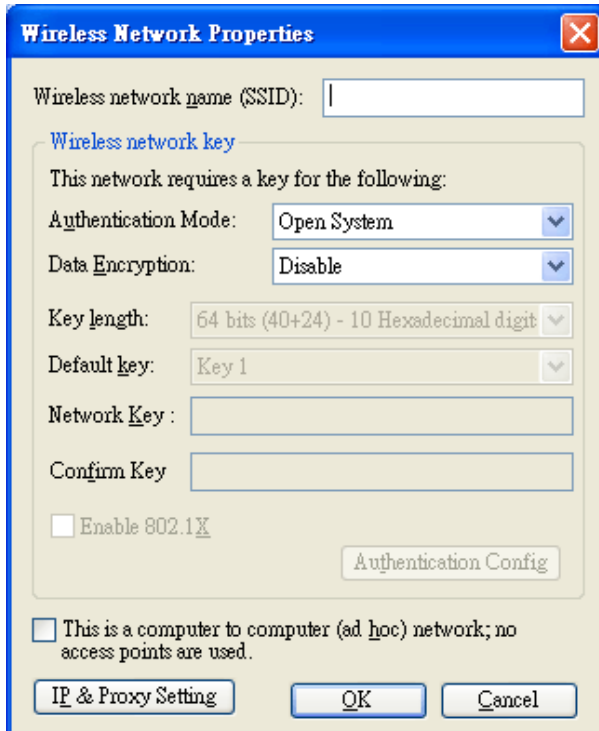

**Properties** It displays properties of current connected AP. For the detailed information, refer to “To add a new WLAN AP...” below.

**Import** It allows you to load a pre-saved profile record into current connected AP. When you want to import such profile, you have to type the correct password for that AWP file.

**Re-Connect** It allows you to select one of the existed profiles for applying with current connected Access Point.

To add a new WLAN AP, please click **New** to open the following dialog.

Different authentication mode will guide different data encryption, key length, default key and so on.

**Wireless network name (SSID)**

Please type the name for the AP or wireless router you want to connect.

**Authentication Mode**

There are six modes provided for you to choose for data encryption in connection.

**Data Encryption**

It will be different according to the **Authentication Mode** you choose.

For **Open System/Shared Key** and **Open System**, the data encryption can be disabled or assigned with WEP.

For **Shared, WPA, WPA-PSK, WPA2** and **WPA2\_PSK**, the data encryption can be **TKIP** or **AES**. You have to choose the one which is the same with the setting configured in AP that you want to connect.

## Key Length

Choose the key length for the wireless card. The method you choose here must be the same as the method set in the connected AP.

Key length:	64 bits (40+24) - 10 Hexadecimal digit
Default key:	64 bits (40+24) - 10 Hexadecimal digits 128 bits (104+24) - 26 Hexadecimal digits 64 bits (40+24) - 5 ASCII digits
Network Key :	128 bits (104+24) - 13 ASCII digits

The number you typed here should be the same as the number set in the connected AP. According to the input method you selected, the characters that you have to set will differ.

For **10/26 Hexadecimal digits**: Type 10/26 hexadecimal numbers in this field.

For **5/13 ASCII digits**: Type 5/13 ASCII characters in this field.

## Default Key

Specify the one which is the same as the setting in the connected AP.

Default key:	Key 1
Network Key :	Key 1 Key 2 Key 3 Key 4
Confirm Key	Key 4

## Enable 802.1X

It will be available when you choose Open System.

## Authentication Config

Such button will be available after you check **Enable 802.1X**. You have to type the same parameters as set in the connected AP. Otherwise the connection will not be successful.

**Advance Security Settings**

**WPA-PSK**  
WPA Passphrase:   
 Check Passphrase

**EAP Type**  
EAP Type: **EAP-TLS**

**Certificate**  
User Certificate:   
 Validate Server Certificate

**User Information**  
User Name:  Domain Name:   
Password:   
Confirm Password:

**TTLS Identity**  
TTLS Identity:

**Trust CA List**  
  
Add Remove

OK Cancel

**WPA Passphrase** - Type the password for authentication with AP while using WPA PSK mode.

**Check Passphrase** - Check this box to make the characters of passwords being visible.

**EAP Type** - A type for authentication between station and radius server while executing 802.1X mode. For some EAP types, you have to choose a sub-item from the drop down menu on its right side for using together. Refer to the following sample graphics.

**User Certificate** – The radius server will assign a user certificate for users. Type the characters in this box.

**Validate Server Certificate** - Check this box to validate the server certificate for radius server.

**User Name** - Type the certificate account for radius server.

**Domain Name** - Type the domain name for the radius server.

**Password** – Type the password for connection with WPA-PSK mode.

**Confirm Password** - Type the password again to confirm it.

**TTLS Identify** – Type the TTLS ID for the radius server.

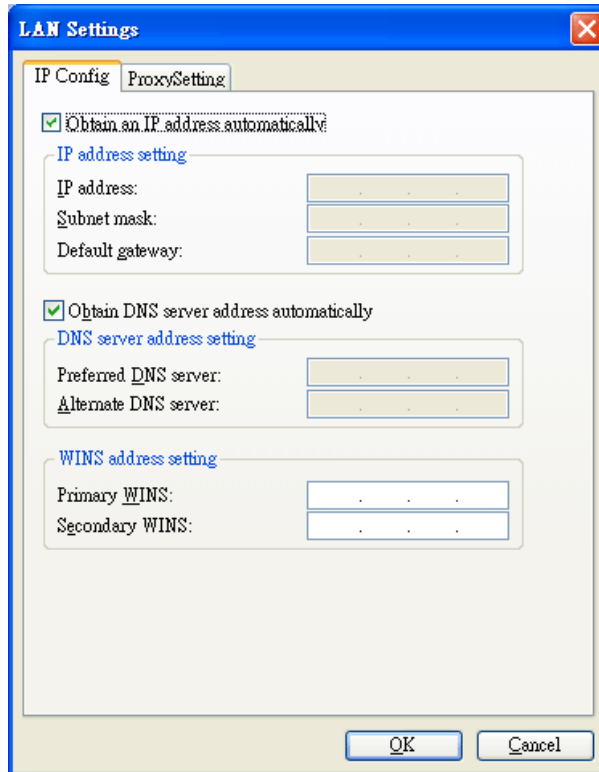

**Add** – You can add a trust CA server by clicking **Add**. The following dialog will appear for you to enter a new name.

**Remove** – For the CA server which is useless, please select that one from Trust CA List and click this button to delete it.

## IP & Proxy Setting

This setting allows you to set **IP and proxy**. Please click this button to open the following window.

**Obtain an IP address automatically** – Check this button to get IP address automatically for such wireless card. If you do not check this button, you have to type IP address, subnet mask and default gateway manually.

**IP Address** – Type the LAN IP address for the wireless card.

**Subnet mask** – Type the subnet mask for the wireless card.

**Default gateway** – Type the default gateway for the wireless card.

**Obtain DNS server address automatically** - Check this button to get DNS server address automatically for such device. If you do not check this button, you have to type Preferred DNS server address and Alternative DNS server manually.

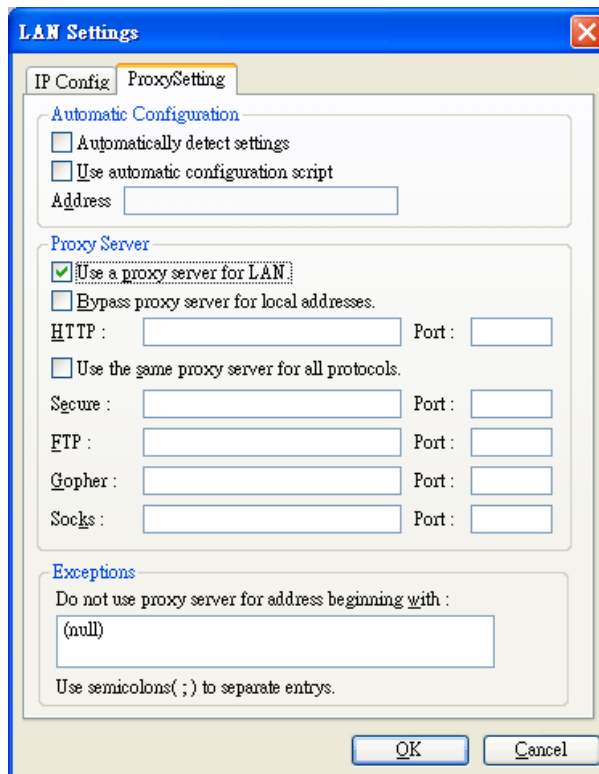

**Preferred DNS server** – Type the address for primary DNS server.

**Alternate DNS server** – Type the address for secondary DNS server.

**Primary WINS** - Type the IP address for primary WINS.

**Secondary WINS** - Type the IP address for secondary WINS.

To set proxy setting, click **ProxySetting** tab to display the following window:

**Automatically detect settings** – Check this box to let the system detect proxy settings automatically.

**Use automatic configuration script** – Check this box to use the configuration script automatically according to the IP address typed below.

**Address** - Type the LAN IP address to get the configuration information for proxy.

**Use a proxy server for LAN** – Check this box to make the proxy server being used in LAN.

**Bypass proxy server for local address** – The proxy server will not be used for local address if you check this box.

**HTTP/Port** – Type proxy IP and port number used for HTTP.

**Use the same proxy server for all protocols** - Check this box to make all the protocols to use same proxy server.

**Secure/Port** – Type proxy IP and port number for secure.

**FTP/Port** - Type proxy IP and port number for FTP.

**Gopher/Port** – Type proxy IP and port number for Gopher.

**Socks/Port** - Type proxy IP and port number for Socks.

**Do not use proxy server for address beginning with** - Type the heading of IP address that you do not want to use as a proxy server.

## Status

This page provides connection status and hardware information for the device. Simply click **Status** tab on the Wireless USB Adapter window.

### Connection Status

It displays current status of connection.

### SSID

It displays the SSID of the AP that your computer connected.

### BSSID

It displays the MAC address for current device.

### Network Type

It displays the mode (Infrastructure or Ad-Hoc) that you set for connecting to AP.

### Frequency

It displays the frequency that this wireless card. used.

### Channel

It displays the channel used for this wireless card.

### Data Encryption

It displays the encryption way for authentication mode used for this wireless card.

### Speed

It displays current transferring rate for the link.

### Authentication State

It displays the encryption status for connection.

### Signal Strength

The longer the red bar for signal strength is, the better the connection effect will be. The graph is active only when you choose Access Point as the network type.

### MAC Address

It displays the MAC address for AP or wireless router that station connected.

### Regulatory Domain

It displays Regulatory Domain for different areas. For example, it will display ETSI (CH1~CH13) for nations in Europe, display FCC(CH1~CH11) for USA, etc.

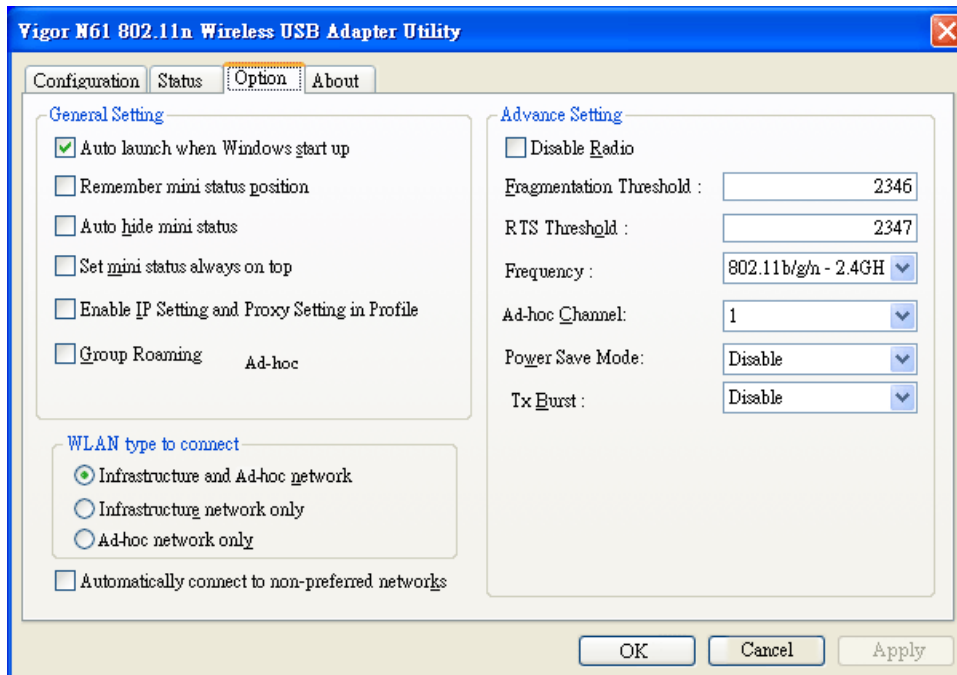

### Radio Status

It displays **On** or **Off** status for this wireless card.

## Option

Simply click **Option** tab on the Wireless USB Adapter window.

### **Auto launch when Windows start up**

Check this button to launch the wireless connection when Windows starts up. If you do not check this box, you can launch wireless connection manually.

### **Remember mini status position**

Remember and fix the position of mini status dialog.

### **Auto hide mini status**

Check this button to hide the mini status icon which appears on the right bottom of the desktop.

### **Set mini status always on top**

Check this button to make the mini status icon to be displayed on the top of the desktop.

### **Enable IP Setting and Proxy Setting in Profile**

Check this box to enable IP setting and Proxy Setting in profile. Refer to IP & Proxy Setting on page 20 for more information.

### **Group Roaming**

You can configure several groups with different APs. The wireless card allows the station to be roamed among different groups of APs. Simply check this box to have group roaming.

### **Infrastructure and Ad-hoc network**

Infrastructure and Ad-hoc network are the common two types for connection through wireless LAN. Click this radio button to make the system selecting suitable type for your device.

### **Infrastructure network only**

Click this button to use infrastructure network only.

### **Ad-hoc network only**

Click this button to use ad-hoc network only.

### **Automatically connect to non-preferred networks**

Check this box to let your wireless card connect to any non-preferred networks if the network you want to connect is failed.

### **Disable Radio**

Check this button to close the connection function of this

wireless card.

**Fragmentation Threshold**

Set the value for fragmentation threshold. The default value is 2346.

**RTS Threshold**

Set the value for RTS threshold. The default value is 2347.

**Frequency**

Please choose the wireless frequency for this card.

Frequency :    

802.11b-2.4GHz
802.11b/g-2.4GHz
802.11b/g/n - 2.4GHz

**Ad-hoc Channel**

Please choose one channel. It must match the channel set in AP.

Ad-hoc Channel:    

1
2
3
4
5
6
7
8
9
10
11
12
13

**Power Save Mode**

To save the power, you can choose **Max Save** or **Fast Save**. The default setting is **Disable**.

Power Save Mode:    

Disable
Max Save
Fast Save

**MaxSave** – It can save lots of power. However, the wireless signal also is bad.

**FastSave**- It is standard mode for power saving.

**Disable** – The power will not be saved. However, the wireless signal will be better.

**Tx Burst**

Such function can increase the data transmission rate within a short time. Choose **Enable** to activate the function, otherwise, choose **Disable** to close the function.

Tx Burst :    

Disable
Enable

## About

This page provides software information such as utility version and driver versions. Simply click **About** tab on the Wireless USB Adapter window.

**Utility Version**

It displays the version number of this utility.

**Driver Version**

It displays the driver version of this wireless card.

This page is left blank

# 4

## Miscellaneous

### Windows Zero Configuration

Each time you power on your computer, the wireless monitor utility will activate automatically after you configured for your PC. If you do not want to activate it but want to enable wireless connection, simply activate Windows Zero Configuration to achieve your goal.

First, you have to check if the Windows Zero Configuration is enabled or not. Go to **Start>>Settings>>Control Panel** and double click **System Administrative Tools >> Service**. The Service window will appear as follows.

Locate Wireless Zero Configuration. If you find that the status of WZC is not enabled, please click the wireless monitor utility icon and choose **Enable Windows Zero Configuration (WZC)** to activate it.

Then follow the steps below to configure WZC.

1. Double click the wireless connection icon on the system tray.

- Next, the following window will appear.

- Click **Change Advanced Settings** and the following window will be shown. Press the **Wireless Networks** tab.

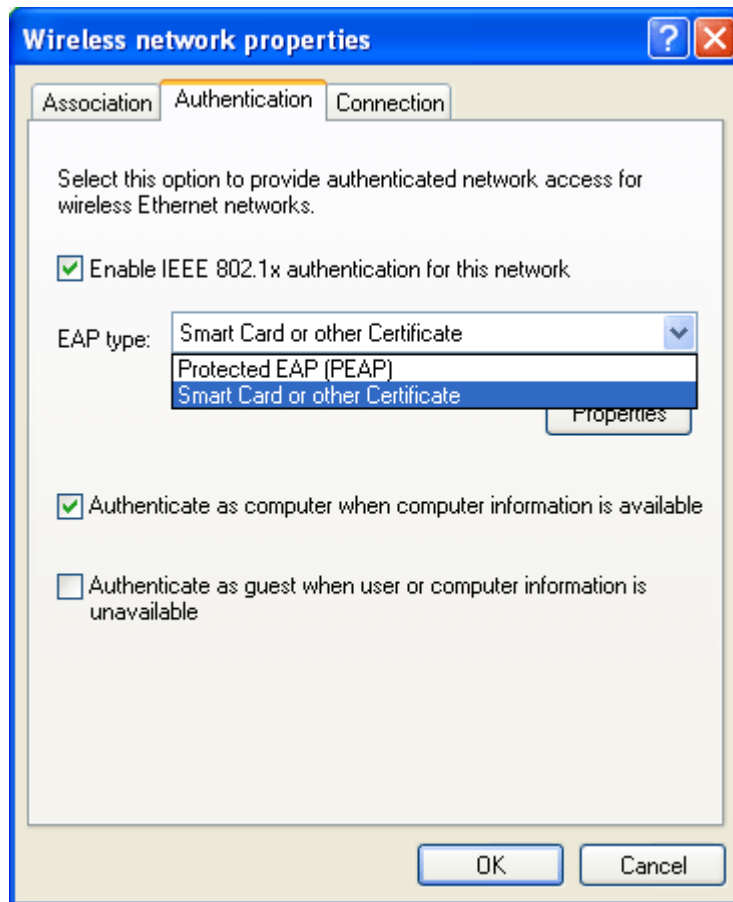

4. Click **Add** to open next window. In this window, type the SSID of the AP that you want to connect with the wireless card. Here, **Tom** is entered as an example. And choose WPA-PSK as the Network Authentication and TKIP as the Data encryption. Then, type the encryption key characters.

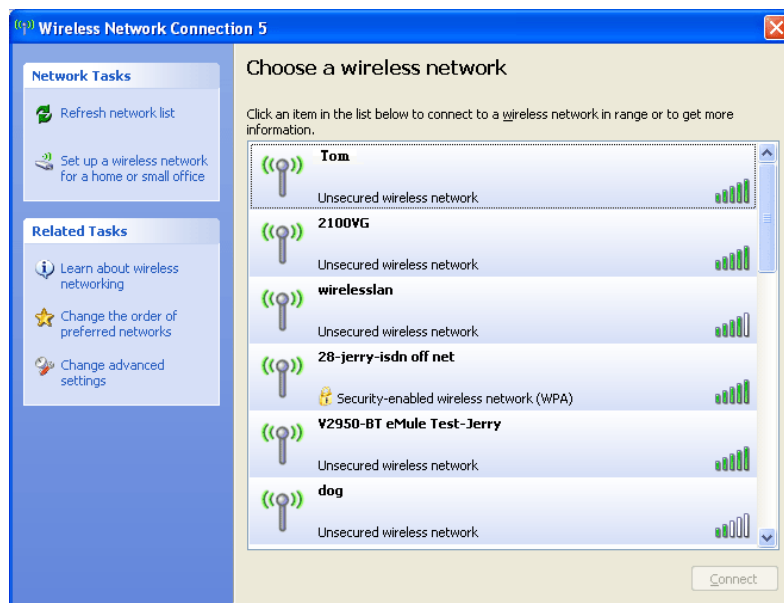

The type for Network Authentication, Data encryption and key must be the same values as configured in the AP that you want to connect.

5. Press the **Authentication** tab. Choose the EAP type which is the same as configured in the AP.

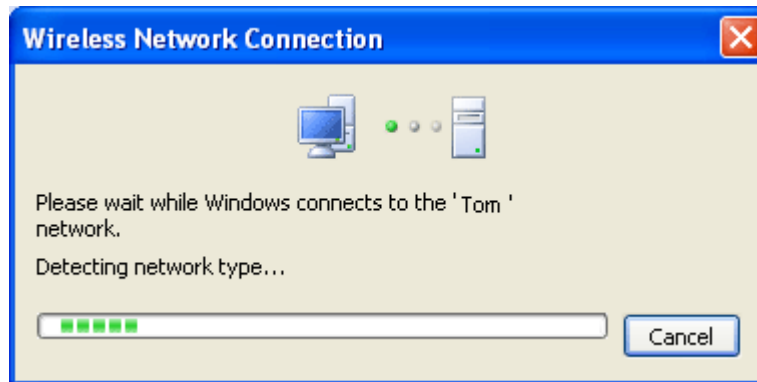

6. After click **OK**, the wireless station can associate with the AP.
7. Open **Wireless Connection** window. Please choose “**Tom**” (as an example) and click **Connect**.

8. The wireless connection starts. Please wait for it completes.

9. The wireless connection has been established.
